LSD  
HCOB 12 May 80 DRUGS AND OBJECTIVE PROCESSES  
HCOB 5 Nov 74 DRUGS, MORE ABOUT

There is such a thing as the "biochemical personality." It is artificial and it is caused by drugs.

The material in this bulletin provides a more comprehensive look than ever before at what we are faced with in these current times in the handling of cases both public and staff, and in the society at large. The data herein is invaluable for use by C/Ses and auditors in the programming and auditing of cases, as well as the handling of people on personnel and ethics lines or on the Qual lines of an org.

Over the past decade, from a routine study of cases it began to appear that there were definite similarities in the personalities of those who had taken drugs. As the drug culture became more widespread and the incidence of hard street drugs became more and more common, the pattern appeared to become more pronounced.

What was showing up was the fact that there appeared to be common denominators among the personality factors of druggies. It occurred to me that there might be something we didn't know about the personality of someone on drugs. The possibility was that there might be such a thing as a "biochemical personality," brought about by the taking of drugs.

Approximately a year ago I decided to dig into this more deeply.

The questions were:

Precisely how common are the similarities in personality factors among cases who have taken heavy drugs?

Is there such a thing as a biochemical (drug-induced) personality? If so, what are its attributes?

Did these cases have those personality attributes before taking drugs?

In other words, the possibility existed that if a normal person had been fed drugs you might find he had turned into a suppressive, or that a heavy this-lifetime restimulation had been brought about, or even whole track restimulation (since drugs were used for implants). It could be you would then find the case in excessive, covert resentment and hostility to the degree that the person was actually going against everything and anything in his environment, but that these factors were hidden from view.

While reserving any final judgement until full research had been done, it seemed to be indicated from the decline society was taking that something happens to the personality because of drugs.

We had long known that heavy drug cases can go quite "dead" or dull and stupid or go into unreal states of high and false euphoria. What needed to be determined from the symptoms being manifested was whether drugs have an action in them which brings about an attitude of covert, hidden hatred or a destructive urge towards anything and everything in the person's vicinity. It could even be that the person had started to take drugs to make himself feel better or even handle things so he wouldn't be so active and the drug then suppressed this into a state which made him covertly, constantly active, in a manner that was out of sight of others around him.

It is quite common for alcoholics to go into a covert state of unrelenting hostility toward everything around them. Severe alcoholics have been known to do people in without ever mentioning it.

So the questions were: Do drugs restimulate past track hatred and resentment? If so, the heavy drug case would be stuck out of present time. Do drugs alter the personality of a person into some kind of destructive, covert individual? Has the drug case learned to be all pleasant seemingly, while he actually rips everything apart?

The co-relative factor in all this was the hard, brutal nature the current society is acquiring.

In the face of the trend civilization is taking, it becomes extremely important to the handling of cases to determine whether drugs do alter the personality of the individual and if so, to what extent and in what way.

An exhaustive study was made of cases who had taken or been given heavy drugs (LSD, Angel Dust and other hard drugs such as heroin, cocaine, speed, etc.). This included detailed examination of pc folders, surveys and interviews carried out with these pcs themselves. Surveys and interviews were conducted as well on associates who had known these or other cases before and after taking drugs.

The following are the particular factors which were checked:

1. The attitude of the person.
2. Outpoints and what type of outpoint.
3. Whether or not the person had a secret hatred.

In addition to the pc folder data obtained, the survey data was established by interviewing:

- a) Persons who had taken heavy drugs, who were asked about what they were like before taking drugs compared to what they were like after taking drugs.
- b) Persons who had not taken heavy drugs but who knew druggie cases both before and after they became druggies.

The results of this research show very definitely that there are personality factors common to heavy drug cases, and that these are drug-produced.

## DRUG-PRODUCED ATTITUDES

From 35 surveys and interviews done, the following is a tabulation of the response to questions regarding changes in personality as a result of taking drugs and attitudes after taking drugs. These surveys were done on drug cases themselves as well as on others who had known them before and after they took drugs.

Lack of ambition/Loss of ambition/ "Don't care"/"Nothing matters": Total = 27.

Introverted/Out of PT/Lack of reality: Total = 18.

Drug-induced neuroses/psychoses: Total = 11.

Attitudes which express a failure or refusal to perceive/predict the consequences of actions and/ or future:

Total = 8.

Couldn't (wouldn't)(didn't) communicate:

Total = 6.

"It wasn't really me"/"Not me" (Out of Valence):

Total = 5.

Anti-learning attitudes (overtly expressed opposition to learning, as different from an inability to learn, or loss of interest in learning):

Total = 3.

Almost one for one the drug cases interviewed stated they had not had such attitudes before taking drugs but had been "open," "outgoing," "had plans for the future," etc.

Folder data from the cases studied shows that very often the individual feels insecure, uncertain of himself. A lot of drug cases do not state their disagreements openly. They are not about to cause trouble (or more trouble) for themselves, but are in a state of hidden mutiny and mention their disagreements in natter to others. Very often there is a statement of "pent up anger," but never expressed or stated to the object of the anger. Instead this would be mentioned covertly to others.

Quite commonly drug cases will go into euphoria and assert they have attained high states of case: "Keyed-Out OT," "Native State," "Cause over the universe," "Natural OT," etc., such states actually being quite unreal.

## OUTPOINTS

The following is a summary of the outpoints expressed in survey replies from persons themselves in regard to themselves after taking drugs or from others in regard to persons who had taken drugs.

Omitted purpose (less ambition) = 6

Dropped out time (operating out of past) = 4

Disassociated = 4

Altered importance = 4

Omitted communication = 3

Omitted prediction = 3

Omitted perception (unaware of environment) = 2

False beingness (out of valence, not myself) = 2

Added time (slow in speech and/or action) = 2

Non sequitur = 1

Wrong target = 1

Note: The outpoints listed above are as observed by persons who had been on drugs and/or by associates of these persons who had observed them before and after taking drugs. The accuracy of the outpoints and frequency of these outpoints is limited by the ability to observe on the part of the person observing.

From folder data among the drug cases studied, common outpoints include the fact that very often drug cases are dishonest, and sometimes obsessively lie (whether "under the gun" or not).

Additionally, such cases often "wrong target" incessantly, i.e., they assign cause or blame to the wrong person or thing.

### **SECRET HATREDS**

Another survey was conducted to find out whether or not any hatred or secret hatred had developed or been observed after the person had gone onto drugs.

Not unexpectedly, this question turned up few replies from the individual drug cases surveyed and even less from those reporting on cases they had known before and after taking drugs. A few cases reported that after drugs, they became rebellious; unpleasant to be around or hard to deal with; that they looked upon the rest of society as being weird and in opposition to themselves; and some became antagonistic to parents.

It is of note that there was very little affirmative survey response on this subject compared to the folder data from pc sessions. By contrast, folder data produced a great deal of data regarding the existence of secret hatreds.

From the folder data gathered, the following is significant:

Many drug cases seem to object to any order or demand in present time that requires their attention. (Signifies that present time orders act as a distraction from the incident they're stuck in.)

All "druggies" fit the description of "stuck in a long gone incident fighting enemies that no longer exist," but this is probably more accurately worded as: "stuck in a long ago incident covertly resisting while appearing to cooperate with their oppressors." Any demand or order or senior or authority in present time restimulates the whole track oppressor or implanter.

Some cases talk of "freedom of the individual" or "rights," but since there is so little of this talk, it would seem that this is heavily suppressed.

Folder search turned up many, many Evil Purposes which came up either in listing Attitudes and Emotions connected with LSD and other drugs, or while running these drug chains. These evil purposes are often of the very generalized type, such as "To kill," "To destroy," "To wipe them out," these usually stemming from implants. From observation of worksheets, the most common words in these statements are "kill," "destroy," "betray."

There are often various statements to do with harboring vengeance, waiting to get even, sabotage, etc., especially when the case gets suppressed (these being more the person's computation or attitude rather than an implanted item).

From worksheet data, many incidents run are along the lines of a battle, one's own civilization defeated, oppression, drugs and implants used to make a slave society, suppressed hatred of the oppressors, apathy, unconsciousness, oblivion and waiting or appearing to be harmless with a faint hope of eventually wreaking vengeance.

Many drug chains were found to go earlier/similar to whole track drug implants. Quite often the whole track incidents run have concerned the person being a spy, double agent, or

saboteur, apparently operating on implanted orders, under drugs and betraying their own people or civilization. (This, as different from incidents of the person acting as a spy or agent in enemy territory, acting against the enemy. Drug case incidents often consist of being drugged, implanted and sent back by the enemy to betray one's own side.)

Some heavy drug cases have made a resurgence on running or pulling O/Ws committed while drugged, while high or while drunk. There are some cases where the person never came near mentioning these O/Ws on other processes or Sec Checks until asked specifically for O/Ws while he or she was drunk or on drugs. In many cases the O/Ws run often have to do with brutal, sadistic acts as well as stealing, etc., to buy drugs.

A common factor found among drug cases is that these mostly respond to Affinity, rather than Communication or Reality and they have very little duplication or understanding.

## **SUMMARY OF DATA**

Most significant in this survey investigation was the high frequency of a statement of an attitude that amounted to: "Don't care"/"Nothing matters." In the context in which this attitude is expressed it is not simply a passive statement of not caring, but an aggressively expressed statement of negation of caring.

Also of interest is the different viewpoint from which this survey was answered as opposed to that shown by folder study. The study of pc folders revealed what these drug cases had to say earlier in the safety of a session, and revealed far more of the discreditable attitudes and secret hatreds, some of which even then only came off as withholds.

Both the survey of persons who had taken drugs and the survey of persons who knew others who had taken drugs, are lacking in much mention of any secret hatreds even though directly asked. This simply confirms that:

- a) the biochemical personality's hatreds are secret, and
- b) that most persons are only dimly aware of any secret hatred from a drug case, if they are aware of it at all.

The surveys of persons who were or had been heavy druggies sound exactly as one would expect them to from the folder study showing what the biochemical personality was like. These confirmed the suppressed protest, hidden resentment of seniors or authority, covert rebellion, etc.

The folder examination was very revelatory in terms of showing there is a "biochemical personality," how common this personality is from one drug case to another and that it is produced by drugs. There is a definite similarity of personality in each of the cases studied in that the person, apparently cooperative, harbors unexpressed resentment; resists orders or control; and is in a state of hidden insurrection. The only difference in this between cases is in degree. The conclusion here is, then, that drugs do restimulate whole track incidents of drug suppression and drug implants and these persons do dramatize this. There is a definite difference, however, in severity of viciousness from one case to another.

It is certain that anybody trying to work with these people would have trouble. It definitely explains the lack of production from such cases. It also explains the mysterious amount of destruction in their vicinity.

## **HARMFUL AND HARMLESS DRUG CASES**

Note that this study was done on cases who had taken heavy drugs. It is possible there are two types of drug "cases"—harmful and harmless. From observation, there are many people who have taken more innocuous drugs such as an occasional aspirin or painkiller, novocaine, alcohol in moderation or who tried smoking marijuana once or twice. One probably wouldn't

categorize these persons as "drug cases" or "druggies" nor as alcoholics. There is some indication that some persons who have had some LSD or some small amount of a hard drug do not become anti-social. On the other hand, from study and observation, there was no case examined who was alcoholic or at all drug addicted who was not anti-social, overtly or covertly.

Although some of the data contained herein was already known and exists in HCOBs, the examination of folders for attitudes, outpoints and secret hatreds, and the examining of the content of whole track incidents run on drug chains, has been extremely eye-opening. I am sure the majority of us have had no idea previously of how common the attitudes of such cases are and how similar the "biochemical personality" is from one case to the next. While it was known that a heavy drug case often appeared dull, bemused and out of present time, the less visible "secret hatred" aspect of the biochemical personality which has been brought to view by this study is something new.

## **HANDLING**

Fortunately, with all the processes of Dianetics and Scientology and especially with the Purification Rundown, the Survival Rundown and a Drug Rundown for any level of case, we have the technology to handle the "biochemical personality."

When the C/S or other tech terminal observes these characteristics in a case he would suspect the person has a heavy drug history in this lifetime whether he has stated he has one or not. But even if a "this lifetime drug history" did not exist, the C/S upon observing these characteristics would know that he was looking at a "biochemical personality" and that this would need to be handled.

## **CONCLUSION**

The results of this study should provide a much greater understanding of what has been going on in the world in terms of the worsening of humanity during the last decade. From this Scientologists can see more clearly what has to be handled and the direction in which Scientology is heading to ensure it is handled.
