An Interference —

In trying to analyze what next process to run on R or P, I found a "bounce" area (try to analyze and you feel "bounced" off it). Realizing this was a VR interference, I found the wording "non-acceptance".

It was a Loop 1 On, who had had this new policy or datum given him in LTA. His original datum from loop 1 was "non-recognition". He ran off easily - and lots of cogs - on the VTI process & BKB. He thought he was very clever to have stayed hidden (non-accepted for auditing and non-recognized that he was there) at first, ^{but} then copped that the game would "never end" and he would be stuck in it as he had been since loop 1. (Ken had "helped" him "evaluate" all this in LTA which kept him trapped.)
